Metric Spaces of Non-Positive Curvature Jun 18 2019 A description of the global properties of simply-connected spaces that are non-positively curved in the sense of A. D. Alexandrov, and the structure of groups which act on such spaces by isometries. The theory of these objects is developed in a manner accessible to anyone familiar with the rudiments of topology and group theory: non-trivial theorems are proved by concatenating elementary geometric arguments, and many examples are given. Part I provides an introduction to the geometry of geodesic spaces, while Part II develops the basic theory of spaces with upper curvature bounds. More specialized topics, such as complexes of groups, are covered in Part III.

The Paradox of Existence May 30 2020 This book is not a merely historical reconstruction of Schelling's thought; its main goal is to provide a contribution for a better comprehension of the importance of the philosophical quest of the young German philosopher from within, which represents a turning point for the whole thought of modernity. I did not describe the various fields of Schelling's work, but I pointed out the central position of his Aesthetics, through the analysis of the inner mechanisms of his concepts. This mechanism, in my opinion, shows the

reason why an Aesthetic philosophy is possible, and why its origin can be traced to Kant's Aesthetics (particularly in Kant's Critique of Judgement) and in the speculations of the early post-Kantian philosophy. The young Schelling's philosophical problems precede his encounter with Fichte's philosophy. Schelling discovers these problems, related to Plato, Aristotle, Spinoza, Wolff, Leibniz and Kant, in the protestant college of the Stift in Tübingen. Fichte confirmed the necessity of an urgent reform of transcendental philosophy, and offered to the young philosopher a philosophical dictionary and an orientation. Schelling exploited these resources with a great degree of autonomy, independence and originality. In these years Hölderlin's influence on Schelling was much greater. Schelling's and Hölderlin's speculations, in these crucial years, were tightly connected.

Finite Element Methods: Oct 15 2021 Finite element methods (FEM), and its associated computer software have been widely accepted as one of the most effective general tools for solving large-scale, practical engineering and science applications. For implicit finite element

codes, it is a well-known fact that efficient equation and eigen-solvers play critical roles in solving large-scale, practical engineering/science problems. Sparse matrix technologies have been evolved and become mature enough that all popular, commercialized FEM codes have already inserted sparse solvers into their software. However, a few FEM books have detailed discussions about Lanczos eigen-solvers, or explain domain decomposition (DD) finite element formulation (including detailed hand-calculator numerical examples) for parallel computing purposes. The materials from this book have been evolved over the past several years through the author's research work, and graduate courses.

101 Questions and Answers on the Four Last Things Jan 26 2020 Joseph Kelley has written a short, accessible, thorough introduction to, and overview of, Christian teaching on death, judgment, hell and heaven, called in theology the four last things. Presented in the popular 101 Questions format, this book shows how these four topics, also referred to as Christian eschatology, have their ancient roots in the sacred books of the Hebrew Scriptures, especially in the later writings known as apocalyptic literature. The New Testament receives and builds upon Jewish thought and piety, finding in Jesus Christ a new revelation about the meaning of death, the nature of judgment, and God's desire that all be saved and united through Christ in heaven. Kelley clearly presents the major theological ideas about the four last things that have emerged in Christian history, as well as the sacramental and pastoral practices surrounding death. Questions range from the simple What makes a cemetery Catholic? to Does the Church believe in reincarnation? to What do other religions say about judgment? and What does it mean to say that Jesus sits at God's right hand in heaven? This one-step guide to Catholic teaching on death, judgment, heaven, and hell is a one-of-a-kind book and will make informative, fascinating reading for high school, college, and graduate courses in theology, religion, psychology, social work, counseling, and ministry, especially death and dying courses. Also, adult education and parish study groups on death and dying as well as Christian support groups for bereavement.

Models of Neural Networks III Aug 13 2021 One of the most challenging and fascinating problems of the theory of neural nets is that of asymptotic behavior, of how a system behaves as time proceeds. This is of particular relevance to many practical applications. Here we focus on association, generalization, and representation. We turn to the last topic first. The introductory chapter, "Global Analysis of Recurrent Neural Networks," by Andreas Herz presents an in-depth analysis of how to construct a Lyapunov function for various types of dynamics and neural coding. It includes a review of the recent work with John Hopfield on integrate-and fire neurons with local interactions. The chapter, "Receptive Fields and Maps in the Visual Cortex: Models of Ocular Dominance and Orientation Columns" by Ken Miller, explains how the primary visual cortex may asymptotically gain its specific structure through a self-organization process based on Hebbian learning. His argument since has been shown to be rather susceptible to generalization. *Graph-Based Representation and Reasoning* Nov 16 2021 This book constitutes the proceedings of the 22th International Conference on Conceptual Structures, ICCS 2016, held in Annecy, France, in July 2016. The 14 full papers and 5 short papers presented in this volume were carefully reviewed and selected from 40 submissions. They are organized around the following topical sections: time representation; graphs and networks; formal concept analysis; ontologies and linked data.

Infinity and the Mind Mar 08 2021 A dynamic exploration of infinity In *Infinity and the Mind*, Rudy Rucker leads an excursion to that stretch of the universe he calls the "Mindscape," where he explores infinity in all its forms: potential and actual, mathematical and physical, theological and mundane. Using cartoons, puzzles, and quotations to enliven his text, Rucker acquaints us with staggeringly advanced levels of infinity, delves into the depths beneath daily awareness, and explains Kurt Gödel's belief in the possibility of robot consciousness. In the realm of infinity, mathematics, science, and logic merge with the fantastic. By closely examining the paradoxes that arise, we gain profound insights into the human mind, its powers, and its limitations. This Princeton Science Library edition includes a new preface by the author.

Finite Automata and Regular Expressions Dec 17 2021 This is a book about solving problems related to automata and regular expressions. It helps you learn the subject in the most effective way possible, through problem solving. There are 84 problems with solutions. The introduction provides some background information on automata, regular expressions, and generating functions. The inclusion of generating functions is one of the unique features of this book. Few computer science books cover the topic of generating functions for automata and there are only a handful of combinatorics books that mention it. This is unfortunate since we believe the connection between computer science and combinatorics, that is opened up by these generating functions, can enrich both subjects and lead to new methods and applications. We cover a few interesting classes of problems for finite state automata and then show some examples of infinite state automata and recursive regular expressions. The final problem in the book involves constructing a recursive regular expression for matching regular expressions. This book explains:

- * Why automata are important.
- * The relationship of automata to regular expressions.
- * The difference between deterministic and nondeterministic automata.
- * How to get the regular expression from an automaton.
- * Why two seemingly different regular expressions can belong to the same automaton.
- * How the regular expression for an infinite automaton is different than one for a finite one.
- * The relationship of a regular expression to a regular language.
- * What a generating function for a language tells you about the language.
- * How to get a generating function from a regular expression.
- * How the generating function of a recursive regular expression is different from that of an ordinary regular expression.
- * How to test divisibility properties of integers (binary and decimal based) using automata.
- * How to construct an automaton to search for a given pattern, or for a given pattern not occurring.
- * How to construct an automaton for arbitrary patterns and alphabets.
- * How the recursive regular expression for nested parentheses leads to the Catalan numbers. Included in this book:
- * Divisibility problems in binary and decimal.
- * Pattern search problems in binary, ternary, and quaternary alphabets.
- * Pattern search problems for circular strings that contain or do not contain a given pattern.
- * Automata, regular expressions, and generating functions for gambling games.
- * Automata and generating functions for finite and infinite correctly nested parentheses.
- * The recursive regular expression for matching regular expressions over a binary alphabet.
- * A further reading list.
